

Introduction

LEDLight Strip is a combination of SMD Leds and extrusion technology. The SMD (Surface Mounted Device) print - the print plate on which the leds have been assembled directly - has been enveloped with a transparent, UV/IR-protected PVC housing. The result is a high-quality product with which you can create colourful and amazing linear light accents. It is a very efficient and multi-purpose solution for various architectural in- and outdoor applications.

Properties

- Flexible linear lighting
- Very clear SMD leds
- Low energy consumption and high light yield
- Protected against damp: IP55
- Available in different fixed colours and RGB
- No maintenance and durable
- Minimal heat generation
- Long extension leads
- Possibilities to shorten, connect and roll
- Extremely functional and multi-purpose
- Dimmable
- Accessories and fitting profiles included

The LED Light Strip is available in 6 different fixed colours (amber, red, green, blue, white, warmwhite) and RGB. With the RGB-edition you can mix fascinating colours and with diverse light programs and fixed colour adjustments you can determine the exact colour and atmosphere. The bespoke lining of the fixed colours (6x12mm) differs from the RGB (11x18mm). Special connection and fitting material has been developed for both measures.

Beside the different sizes, the power (fixed colour: 3,6W/m, RGB: 7,2W/m) and the maximum connecting length also differ. Apart from that, nearly all technical specifications are the same. Both strips have a led-distance of 28,5 mm and it is possible to shorten them every 20 cm (equal to 7 leds).

Accessories

For the fitting we deliver mounting materials such as rounding clips, u- profiles and aluminium profiles.

You can fit the LED Light Strip in numerous ways, such as:

- Sinking in wood (having cut out the wood)
- Gluing
- Mounting in various aluminium profiles
- Grouting
- Etc.

Power supplies, dimmers, RGB/Dim Controllers and aluminum profiles

Tri-O-Light has selected a number of special supplies and dimmers, and has developed RGB/Dim Controllers and aluminium profiles to complement the system.

Applications

Because of its versatility and many advantages the LED Light Strip is suitable for many applications in various categories:

- Architecture, ambience & decorative lighting
- Accent lighting
- Contour lighting
- Cove lighting
- Recessed lighting
- Route-, marking lighting
- Stair-, doorstep and skirting lighting
- Floodlight

Entertainment & leisure

- Stage, theatre, club or casino lighting
- Pool, health spa, sauna lighting

Displays & advertising

- Lettering
- Advertising lighting
- Display lighting

General lighting

- Emergency and safety lighting
- Retail, corporate, public, residential

We clarify a number of these applications by showing some pictures and information.

Connection scheme

Instructions for connection scheme

1. Cut the strip with a 25 mm strip-cutter at the indicated places (2x).
2. Lay the strip in the mould and use a knife to cut the PVC loose from the print to the V1 and V2 markings or up to the end of the lines. Remove the PVC without damaging the PCB.
3. Fill the connections with PVC-glue for a watertight connection.
4. Place the stripped strip in the connector with the PVC glue. In order to ensure a proper connection, make sure that the connections are aligned.
5. Use a connector to make a corner. The strip must not be bent over the side.
6. Use an in-line connector to connect two strips.
7. Place a RGB Controller between the supply and the LED Light Strip to enable the strip to be controlled. The + and - connections must be aligned.
8. When applying the RGB/ Dim Controller, there are three steering possibilities: A) DMX, B) 0-10V or C) with potentiometers.
9. Connect everything to a 24VDC source. This connection is polar sensitive! The + and - connections must be aligned. (the cable with text = +).

RGB Ceiling fixtures - Schiphol airport

The Heijmerink Wagemakers design studio created this light object for the Schiphol Plaza (Amsterdam, The Netherlands) ceiling. The idea was to decoratively fill the ceiling with a 5m diameter fixture and to determine the atmosphere by changing the colour, depending on the season or the event. Thanks to the co-operation with Tri-O-Light, this project has turned out to be a winner. Every single ceiling fixture contains a Tri-O-Light 30m LED Light Strip RGB and RGB Controller. On top of that, made-to-measure DMX command consoles were developed, including 5 pre-sets containing the colour schemes as required by the customer. All in all, 22 ceiling fixtures have been fitted.

LED Light Strip RGB

Qbic Hotel (Amsterdam, The Netherlands) is a design hotel with a futuristic image. The heart of the hotel is the cubic shaped living area, also called the 'Cubi'. The contours of the 'Cubi' are lit with LED Light Strip RGB. With the touch of a button, guests can create the atmosphere that fits the mood at that exact moment: 'mellow yellow', 'red romance' or 'deep purple love'. Every Cubi holds a total of 12m LED Light Strip with RGB Controller and 150W supply.

LED Light Strip RGB

LED Light Strip RGB is very powerful and excellently suited for concealed lighting. The advantage of LED Light Strip RGB is the flexibility in the regulation of colour. With the touch of a button or with support from DMX, it is possible to create a floodlight in any chosen atmosphere. (Qbic Hotel, Amsterdam, The Netherlands)

LED Light Strip RGB

Restaurant 8th (Ede, The Netherlands) has been completely re-styled. Thanks to Tri-O-Light LED Light Strip RGB the restaurant has acquired a trendy look. The bar, the bottle rack and the frames of the separate parts of the restaurant can change colour at the same time. With the touch of a button you can change the atmosphere in the whole of the restaurant, thanks to an RGB/Dim Controller from Tri-O-Light and a made to measure DMX command console from Crew. Everything is easily controlled from a central point.

LED Light Strip RGB

Villa Ruimzicht Hotel Restaurant is located in a park at the edge of the centre of the city of Doetinchem (The Netherlands). The grand and majestic building has been renovated to what it was and since September 2007 it has been used as a hotel. Every room has been fitted with Tri-O-Light MR16 RGB spots. By applying a combination of a master and slaves, you can simultaneously change the light colour. Remote control enables the guest to personally change the light and the colour in the room.

LED Light Strip RGB

Villa Ruimzicht Hotel Restaurants, Doetinchem, The Netherlands

RGB Controllers

Tri-O-Light has developed a pair of RGB Controllers to steer LED Light Strip RGB; the advanced RGB/ Dim Controller in combination with DMX-512 and the stand alone RGB Controller.

RGB / Dim Controller

This advanced 15 bits controller delivers a beautiful, even dim pattern. The controller has been developed for dim functions (LED Light Strip II) and RGB-applications (LED Light Strip RGB).

Controls

The RGB controller has 3 steered exits which can be charged with 8A (92W) at the most. The exits are controlled with a DMX512 panel or a very easy to use wall panel with remote control. The RGB Controller can also be used with an analogue 0-10V signal or with internal or external trim-pots.

Software

The possibility to perform 'stand alone' programs completes the controller. You can exchange these programs with the RGB controller with a PC in an upload- and download function. With the provided software, you can install all possible functions quickly and conveniently. The most important functions can be installed with both the software and the jumpers on the print.

Maximum connecting lengths

You can make one long line of 60m, because of the maximum connecting length of 10m of the LED Light Strip RGB and the maximum length of the extension cable of 20m. If we are not dealing with one long line, you can connect up to 80m (8 x 10m) to an RGB Controller; maximum 192W per exit. Make sure you do not exceed the maximum connecting and extension cable length (See connecting scheme).

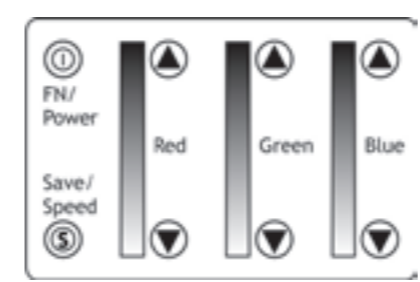

RGB Controller

A simple control panel steers this RGB Controllers. Instructions of the control elements of the RGB Controller are written below. The RGB Controller can be charged with maximum 144W. In view of the maximum connecting length of 10m of the LED Light Strip RGB, you can connect two lines of 10m at the most.

Control elements

- (I) FN/ Power
- 1 sec. (I) = On, one more time (I) is go to the next modus (4x)
- 5 sec. (I) = Off
- Mode 1 = Colour change according to memory
- Mode 2 = Jumping colour change of 7 colours
- Mode 3 = Flowing RGB colour change
- Mode 4 = Installation modus

- (S) Save/ Speed
- (S) from mode 4 = save (save chosen colour to mode 1)
- (S) from mode 1, 2, 3 = speed (control speed of colour change)
- 1x (S) speed is 5 sec., 2x (S) speed is 15 sec., 3x (S) speed is 30 sec.
- Arrows upwards/ downwards = mixing colours from mode 4. (I) skip, (S) save.

LED Light Strip RGB

In the entrance and halls of the Pantazis Royal conference centre in Argos, Greece, the ceiling frames are fitted with LED Light Strip RGB. They are all controlled with the advanced RGB/Dim Controllers of Tri-O-Light in combination with DMX. The result is an easy to control atmosphere lighting with fascinating colour changes.

LED Light Strip RGB

Optician Akkerman International Eye Fashion in Rotterdam, (The Netherlands), has become a true design store, partly because of the RGB LED lighting. The Perspex wall, which shows the trends in glasses since 1900 until now, sits at 14cm in front of the rear wall. A total of 120m strip was mounted horizontally behind the perspex on the rear wall by means of mounting clips. The result is a diffuse wall with fascinating colour changes, which is user-friendly and controlled by means of a DMX-panel.

Connection scheme

Instructions for connection

1. Cut the strip at the places indicated with a 25 mm strip-cutter (2x).
2. Place the strip in the mould and use a break-knife to cut the PVC loose from the print up to the + and - markings or up to the end of the lines. Remove the PVC without damaging the PCB.
3. Fill the connections with the PVC-kit for a watertight connection.
4. Place the stripped strip in the connector using PVC glue. Make sure the connections are aligned for a proper connection.
5. Use a connector to make a corner. The strip must not be bent over the side.
6. Use an in-line connector to connect two strips.
7. Place a 24VDC dimmer between the source and the LED Light Strip, to enable the strip to be dimmed. The + and - connections must be aligned.

LED Light Strip - blue

Project illustration

LED Light Strip - blue

Project illustration

LED Light Strip - blue

LED Light Strip - warm white

In the interior of the 36m long Super Yacht Arcadia, built by Royal Huisman Shipyard BV, (The Netherlands) and designed by interior stylist Dick Young Design, a warm white coloured LED Light Strip was used. The LED Light Strip is used as indirect ambient lighting underneath the steps in the 'Salon', as skirtingboard lighting in the back of the 'Dining' and in the several glass door cupboards of the 'Guest Cabin'. The set-up is dimmable.

LED Light Strip - warm white

In the interior of super yacht Gliss, designed by interior stylist Dick Young Design and built by Royal Huisman Shipyard BV, (The Netherlands) the warm white coloured LED Light Strip was used. The LED Light Strip is used as an indirect ambient lighting underneath the steps, as skirtingboard lighting and as indirect lighting in the several cupboards. LED Light Strip is also used in superyacht Antares.

LED Light Strip - blue

The Orpheus theatre in Apeldoorn, The Netherlands, used the blue LED Light Strip on the sides of the balconies and underneath the curtains. The lighting was fitted using U-profiles. The blue illumination accentuates the contours and different levels of the balconies and illuminates the curtains with a beautiful blue floodlight. The set-up is completely dimmable.

LED Light Strip - warm white

The VROM ministry in The Hague, The Netherlands, was decorated in 2005 with a new lighting design. To preserve energy, the escalators have been fitted with a warm white LED Light Strip. Energy costs were reduced by more than 90%. The lighting can be used as backup lighting, route marking or as emergency exit lighting. But it was mainly used aesthetically in this project and meant to give the escalators a better look.

LED Light Strip - warm white

The artwork "Zaan Zang", designed by Marc Ruygrok is beneath the A8, a highway that runs right through the old city centre of Koog aan de Zaan, the Netherlands. The concrete pillars are lined with stainless steel. Arie van den Berg poems, inspired by Koog aan de Zaan, are cut into it. Dynamicom Lichtarchitectuur (Lighting Architecture) created a light design to light the text 24 hours a day. In the space between the concrete and the stainless steel, a warm white colored Led Light Strip has been used.

Power supplies 24VDC

Tri-O-Light has selected a few stabilized 24VDC power supplies and transformers. These power supplies meet the highest standards and are excellent to use in combination with the LED Light Strip. When the power supplies don't mention a protection category they must be built in a cupboard. Take care of proper ventilation in that case. To minimize loss of voltage, make sure the cable is not longer than 20m.

Calculation

You can select the right power supply by multiplying the number of metres with the Watt per meter. The maximum connection length must not be exceeded. For optimal use, add an extra 5-10% power. Example: 10m LED Light Strip RGB = 10m x 7,2W/m = 72W + 5% is 75.6 => 100W power supply.

Dimmer built-in/on, 12-24VDC, white [pc]

Dimmers

LED Light Strip can be dimmed. It is, however, not possible to use conventional dimmers on the LED Light Strip. In the chapter 'Dimmers' you will find a number of suitable dimmers. You can also use the RGB/Dim Controller. The dimmer (24VDC) is placed between the source and the LED Light Strip (see connection scheme).

12-24VDC

Digital dimmer

011457

Description
Digital dimmer with push button, 10A, 10-32VDC [pc]

LED Light Strip - green

In the cabin of the yacht 'Cruz del Sur' (Italy) a green LED Light Strip was used. The colour and the brightness of the LED-lighting is meant to have clearly readable instruments also at night. The voltage of the LED Light Strip (24VDC) made the fitting on the yacht easier. A DC/DC converter was used however, to ensure stabilized voltage. The set-up is completely dimmable.

LED Light Strip - blue

In this parking lot (Q-park), the blue LED Light Strip was fitted in a cove above the old city wall of Maastricht (The Netherlands). The led-lighting has a decorative purpose and creates a blue ambient lighting along the wall. The black wall/ floor profile holds the strip in place.

LED Light Strip II - warm white

The warm white LED Light Strip II has been fitted in the beautiful frames in several rooms of this house. The set-up is completely dimmable.

LED Light Strip II blue

The server room of ROC A12 MBO educational institute (Ede, The Netherlands) has completely been fitted with the blue LED Light Strip II, purely for atmosphere purposes. The colour blue was chosen because of its association with water and the water-cooled Rittal server cupboards. The LED Light Strip has been fitted using Tri-O-Light u-profiles. Each cupboard takes up about 4m and a 20W transformer. ITN Installatietechniek (ITN Fitting Techniques) have fitted the whole set-up.

Stair profile & Wall/floor profile

These profiles are only applicable for LED Light Strip II. The stair profile has anti-slip grooves. Both profiles are screwed or glued onto steps, wall, floor or ceiling. The LED Light Strip can easily be pressed into the profile and is not easily removable.

Aluminium profiles

The aluminium profiles have been developed especially for the LED Light Strip. They are ideal for functional and decorative applications such as marking stairs, floors, walls and ceilings in theatres, cinemas and clubs.

Line profiles

The line profiles are available in two widths: 20mm and 40mm. In combination with a LED Light Strip and frosted or clear acrylic a diffuse light line can be created. Several accessories are available to fix and mount the profiles. The profile has a white epoxy coating. These line profiles are suitable to build in and on floors and walls.

Wall profile indirect

The 'wall profile indirect' is designed to create floodlight effects along a wall. The profile consists of a fitting profile, which is screwed to the wall, the cover, the polycarbonate and the end caps. This system is "lout-proof" (also suitable for applications in public places) and can not be taken apart easily. The profile is available in silver grey, black and white.

LED Light Strip with line profile

T-for Telecom used the white LED Light Strip for their renewed interior concept. This project uses the 20mm line profile. The LED Light Strip was mounted inside the 20mm line profile using a u-profile. The yellow T-for-Telecom colour was created with a yellow diffuse acrylic cover. The result is an illuminated diffuse line, visible on the furniture and cupboard partitions. The line has only a decorative purpose and meant to create a bright, fresh and renewing accent.

LED Light Strip with stairnosing profile

This exhibition hall in Rijswijk, The Netherlands, applied LED Light Strip in combination with black anodic aluminium stair profile. The aluminium stair profile has anti-slip grooves and ensures extra safety with the bright led-lighting. A functional and decorative solution at the same time.

LED Light Strip with stairnosing profile

In order to create more safety and comfort, Motala Train AB upgraded a number of regional passenger trains by means of LED-lighting. They installed aluminium stair profiles with LED Light Strip and integrated the wall/floor profile in the entrances for the disabled. Purpose of the installation was to increase safety and overview when getting on and off. It is an aesthetic and at the same time durable innovation.

Warning

- Please remember during the fitting procedure that you are dealing with an electrical device. Handle with care. Ensure mains supply is switched off before commencing work.
- The LED Light Strip cannot withstand a voltage fluctuation. Always use a stabilised 24VDC power supply and check on sufficient power and right voltage.
- In situations where power supplies are not stabilised, for example on a car or boat, it is necessary to use a DC-DC converter; see the chapter 'power supplies'.
- The maximum connection length of the LED Light Strip must not be exceeded. The cable from the strip to the power supply cannot be longer than 20m to prevent voltage loss.
- As (led) diodes are used, the dimming characteristic is not linear. Therefore it is not possible to dim with conventional dimmers.
- Cut the strip on the section markings only. In each section the leds are connected in series. The section should not be interrupted or damaged. Once the LED Light Strip is cut, the IP-rate (IP66) is no longer guaranteed.
- Ensure, when connecting the accessories, that the + and - signs on the connectors are aligned to ensure a correct connection.
- Keep connector sets, end caps and connectors out of reach of water or moisture or make sure that all connections are sealed 100% waterproof, using PVC-kit.
- LED Light Strip cannot be connected or used when coiled. Keep a minimum bend radius of (>) 150mm when bending the strip forwards or backwards. The strip must not be bent over the sides.
